

PROMATIS PROCESS MINING. IMPROVE YOUR PROCESS.

What is Process Mining?

Process mining is a method that analyzes digital traces in IT systems and re-constructs a real picture of business processes from concrete event data, the so-called log files.

Process mining focuses on a meaningful representation of the processes within a company. The objective is to capture these processes in their entirety, identify their weak points and visualize their effects, based on which they can subsequently be adjusted and optimized.

What can Process Mining do?

An innovative process mining product extracts the digital process traces from a variety of source systems (including Oracle E-Business Suite, Oracle Applications Cloud) in real time and links to the individual document level across any desired metrics. In addition to the visualization of the processes, compliance violations, unnecessary process steps and delays are specifically searched before being systematically analyzed and form the basis for process optimization.

What are the benefits of PROMATIS?

Process mining is an integral part of the PROMATIS service portfolio for Business Process Excellence. We use innovative products of leading providers, which are available on premise or in the cloud. This is complemented by the process mining expertise in combination with the profound Oracle application and technology know-how of PROMATIS' experts. This combination allows the visualization of potential improvement in no time and provides a basis for efficient process design.

PROMATIS and Process Mining

Innovative process mining products combined with the solid process know-how of PROMATIS are an ideal addition that is reflected in a harmonious integration. During this process, the profound knowledge of the business processes and a high degree of client orientation are the focus of attention.

PROMATIS Business Process Excellence

The service portfolio for Business Process Excellence includes the examination of complex processes within the company. The services extend far beyond the optimization of business processes - adaptable business processes are designed and implemented that offer potential for continuous adjustments to changing business models and market conditions.

Process Mining

The goal of process mining is simple: to analyze today's business processes, so tomorrow's processes will be more efficient. Scalable process mining solutions that analyze all business processes include comprehensive functions for managing user roles, data sources and analyses.

Features Celonis Process Mining

- » Reconstruction and visualization of processes by using digital traces from IT systems.
- » Identification of weak points and creation of foundations for an efficient process flow.
- » Intuitive user interface for fast identification of causes and easy search for solutions.
- » Automated target/actual comparison and visualization of impacts on process performance.
- » Real-time optimization for rapid response to changes.

Scope PROMATIS Process Services

- » Support services for embedding process mining software into the system landscape.
- » Creation of customer-specific analyses as well as graphical evaluations and tables.
- » Reconstruction of the actual process models and documentation of the target process models either in BPMN or Horus.
- » Interpretation of the analysis results, conceptual design of options for action.
- » Implementation support for process improvements through project management, organizational change management and quality assurance.

Your benefits

- » Meaningful analysis of real business processes.
- » Intelligent evaluation of processes and identification of optimization potential.
- » Drill-through analysis.
- » Development of concrete improvement concepts.
- » Modeling optimized processes with the Horus Business Modeler.
- » Efficient realization through process and project know-how.
